HMC832LP6GE Fractional N PLL with Integrated VCO

HMC832 Functional Block Diagram

HMC1060LP3E Voltage Regulator Functional Block Diagram

HMC832 Pin Voltages:

Pins 2, 5, 6, 8, 9, 11 to 14, 18 to 22, 24, 26, 34, 37, 38: Not Connected.

Pins 1, 3, 7, 10, 16, 17, 25, 27, 35, 36, 39: 3.3V (Min 3.1 V – Max 3.5 V).

Pin 4: Charge Pump Output. Connected to Loop Filter.

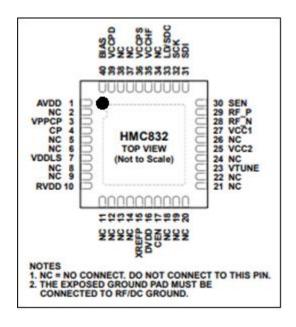

Pin 23: Tune Voltage Input. Connected to Loop Filter.

Pin 15: Reference Oscillator Input.

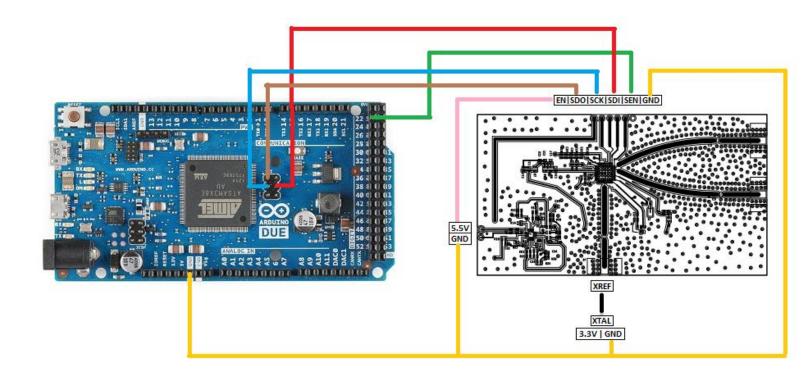

Pin 28-29: VCO Outputs.

Pin 30-33: SPI Interface (pin 30: SEN, pin 31: SDI, pin 32: SCK, pin 33: LD/SDO)

Pin 40: External Bypass Decoupling for Precision Bias Circuits.

Connections

As visible in the PCB print, the path leading from XREF to the HMC832 IC has a VIA which interrupts that path and grounds the XREF input. To correct this problem, the via was scratched using a blade and it was checked that the XREF reached the metal pin on the IC. The VCO subsystem cannot be programmed without XREF.

HMC832 Technical Details:

- 1. **Bandwidth:** 25 3000 MHz
- 2. **Input Supply:** 3.3 V (Min 3.1 V Max 3.5 V).
- 3. **Absolute Maximum Pin Ratings:** -0.3V to +3.6V.
- 4. Output Gain: 0-11 dB
- 5. **Integrated Phase detector:** Maximum 100 MHz
- 6. Delta Sigma Modulator.
- 7. Built in Self-Test and Lock Detect.
- 8. Cycle Slip Prevention.
- 9. **In-Band Phase Noise Floor:** -110 dBc/Hz.
- 10. Fractional Figure of Merit: -226 dBc/Hz.
- 11. Single ended or differential output.
- 12. **Power on Reset:** All Registers are programmed to default values at power up. It takes 250us. By default, Fractional Mode is enabled with Auto-calibration and the Outputs are not enabled. However, if Power on Reset is successful, a faint peak at 2310MHz is visible on the frequency spectrum and HMC832 enters Ready mode where it has to select SPI mode, based on whether rising edge occurs first on SCK or SEN pin. The default variables are given below. Their descriptions are included in code.

5	R/W	GPO test data	1	0	31: soft reset, RST 1: GPO test data

14. **VCO:** 256 sub-bands and range 1500MHz – 3000MHz. Either VTUNE or CAPS (VCO_REG_00) can be used to select VCO sub-band or change VCO frequency.

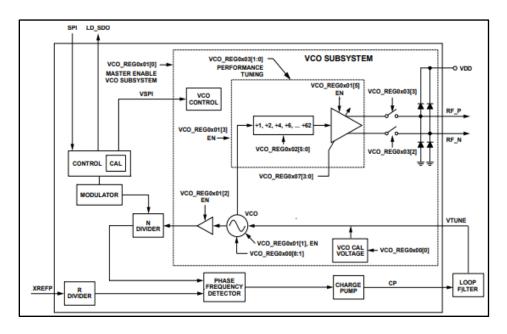

15. **Two Subsystems:** PLL subsystem and VCO subsystem.

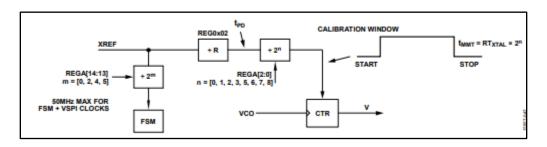

PLL subsystem: Programmable through external SPI Clock. It is enabled through CEN pin. PLL Subsystem Registers can be written and read back as well.

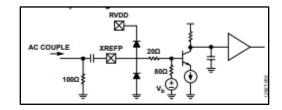

VCO subsystem: Indirectly addressed through PLL_REG_05. VCO Subsystem Registers can be written but not read back.

VCO Subsystem is programmed through FSM/ VSPI Clock (Derived from XREF: External Reference Source Frequency). If External Reference Crystal power is lower than threshold, VCO subsystem will not be programmed correctly.

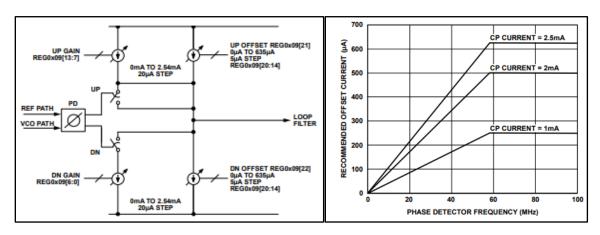

16. **Reference Input:** Maximum 350 MHz at +12 dBm (AC Coupled). Recommended frequency, shape and power are given in the table below.

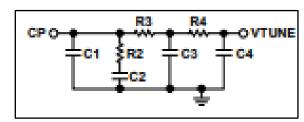

Square Input				Sinusoidal Input				
Reference Input	Slew > 0.5 V/ns Recommended		d Swing (V p-p)		Recommended Power Range (dBm)			
Frequency (MHz)	Recommended	Minimum	Maximum	Recommended	Minimum	Maximum		
<10	Yes	0.6	2.5	No	No	No		
10	Yes	0.6	2.5	No	No	No		
25	Yes	0.6	2.5	Okay	8	15		
50	Yes	0.6	2.5	Yes	6	15		
100	Yes	0.6	2.5	Yes	5	15		
150	Okay	0.9	2.5	Yes	4	12		
200	Okay	1.2	2.5	Yes	3	8		

17. **Charge Pump:** Connected between output of Phase Detector (PD) and input of Loop Filter. Both Up and Down gains (Typically 2-2.5 mA) must be equal. The Up and Down Offsets must be non-zero for Fractional Mode only. Offset value depends on Phase Detector Frequency (XREF/R).

18. Loop Filter: Type 2 Loop Filter was connected between CP and VTUNE pins.

Loop Filter Type	Loop Filter BW (kHz)	Loop Filter Phase Margin	C1 (pF)	C2 (nF)	C3 (pF)	C4 (pF)	R2 (Ω)	R3 (Ω)	R4 (Ω)	Loop Filter Design
Type 1 ¹	127	61°	390	10	82	82	750	300	300	See Figure 52
Type 2 ²	75	61°	270	27	200	390	430	390	390	
Type 3 ³	214	71°	56	1.8	NA	NA	2200	0	0	

¹ Loop Filter Type 1 is for best integrated phase noise. Loop filter bandwidth is designed for 50 MHz PD frequency, CP = 1.6 mA at 2.2 GHz output in fractional mode.

² Loop Filter Type 2 is suggested to use for best far out phase noise. Loop filter BW is designed for 50 MHz PD frequency, CP = 1.6 mA at 2.2 GHz output in fractional mode.

³ Loop Filter Type 3 is suggested to use for best integrated phase noise at integer mode. Loop filter bandwidth is designed for 50 MHz PD frequency, CP = 2.5 mA at 3 GHz output in integer mode.

Modes of Operation:

- 1. Output Mute and Power Down Function: VCO and PLL must be shut down separately.
- 2. Fundamental Frequency Mode: 1500 MHz 3000 MHz

The VCO sub-band is chosen using VCO_REG_00 (CAPS).

3. **Integer mode:** 25 MHz – 3000 MHz

Both Fractional Modulator and Delta-Sigma Modulator must be disabled.

Output Frequency Divider Ratios of 1/2/4/6/.../62 are available.

N_{INT} Divider may be programmed to any integer from 16 to 524287.

$$F_{out} = \frac{(\frac{XREF}{R})(N_{INT})}{Output\ Divider}.$$

Charge Pump offset must be zero.

Typically, the Charge Pump Up and Down gains must be equal and non-zero.

If Auto calibration is disabled, the VCO sub-band is chosen using VCO_REG_00 (CAPS).

If Auto calibration is enabled, the VCO sub-band is chosen automatically using VTUNE by internal Finite State Machine after the PLL Registers 0x03 or 0x04 are written.

4. Fractional Mode: 25 MHz – 3000 MHz

Both Fractional Modulator and Delta-Sigma Modulator must be enabled. Output Frequency Divider Ratios of 1/2/4/6/.../62 are available.

N_{INT} Divider may be programmed to any integer from 16 to 524284.

Fractional Divider value N_{FRAC} can be set from $(\frac{1}{2^{24}})$ to $(\frac{2^{24}-1}{2^{24}})$.

$$F_{out} = \frac{(\frac{XREF}{R})(N_{INT} + N_{FRAC})}{\textit{Output Divider}}.$$

Both Charge Pump gain and Offset may be non-zero.

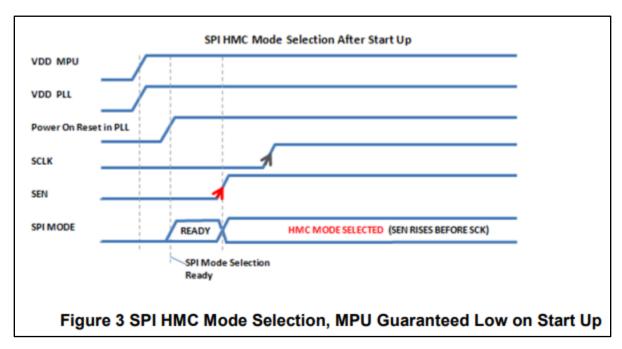

If Auto calibration is disabled, the VCO sub-band is chosen using VCO REG 00 (CAPS).

If Auto calibration is enabled, the VCO sub-band is chosen automatically using VTUNE by internal Finite State Machine after the PLL Registers 0x03 or 0x04 are written.

- 5. **Exact Frequency Mode:** 0 Hz error can be achieved for special frequencies in Fractional and Integer Frequency Mode.
- 6. **Auto calibration Function:** The VCO sub-band is selected automatically using VTUNE by the internal Finite Sate Machine after the PLL Registers 0x03 or 0x04 are written.

SPI Modes:

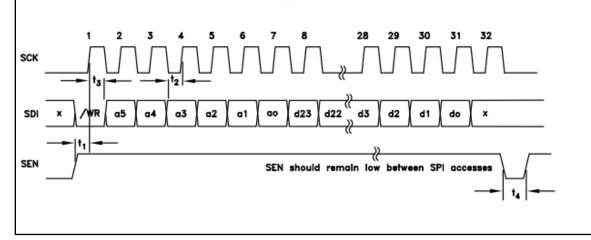

1. HMC Mode: First Rising Edge must occur on SEN pin before SCK pin after Power On Reset. My Code and HMC832 Evaluation Software use HMC Mode for SPI Write.

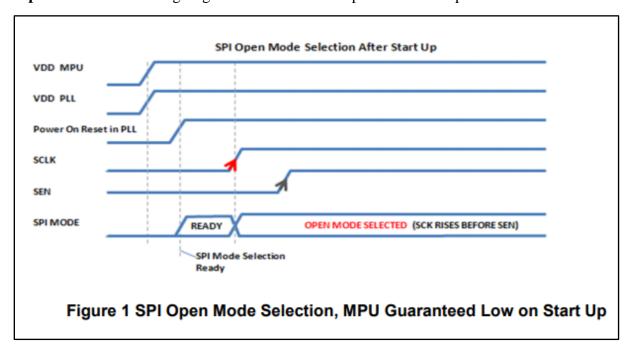

HMC Mode Write Timing Diagram.

- The slave (synthesizer) reads SDI on the 1st rising edge of SCK after SEN. SDI low indicates a Write cycle (/WR).
- c. Host places the six address bits on the next six falling edges of SCK, MSB first.
- d. Slave shifts the address bits in the next six rising edges of SCK (2-7).
- e. Host places the 24 data bits on the next 24 falling edges of SCK, MSB first.
- f. Slave shifts the data bits on the next 24 rising edges of SCK (8-31).
- g. The data is registered into the chip on the 32nd rising edge of SCK.
- SEN is cleared after a minimum delay of t₅. This completes the write cycle.

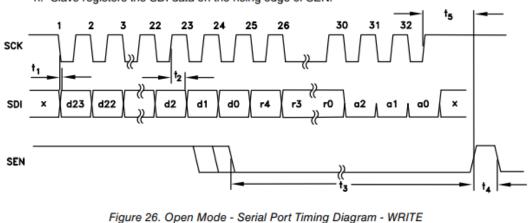

2. Open Mode: First Rising Edge must occur on SCK pin before SEN pin after Power On Reset.

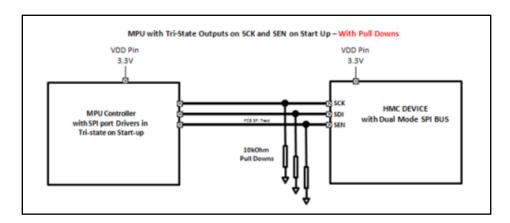

HMC Mode Write Timing Diagram.

- a. The Master (host) places 24-bit data, d23:d0, MSB first, on SDI on the first 24 falling edges of SCLK.
- b. the slave (PLL with Integrated VCO) shifts in data on SDI on the first 24 rising edges of SCLK
- Master places 5-bit register address to be written to, r4:r0, MSB first, on the next 5 falling edges of SCLK (25-29)
- d. Slave shifts the register bits on the next 5 rising edges of SCLK (25-29).
- e. Master places 3-bit chip address, a2:a0, MSB first, on the next 3 falling edges of SCLK (30-32). Hittite
 reserves chip address a2:a0 = 000 for all RF PLL with Integrated VCOs.
- f. Slave shifts the chip address bits on the next 3 rising edges of SCLK (30-32).
- g. Master asserts SEN after the 32nd rising edge of SCLK.
- h. Slave registers the SDI data on the rising edge of SEN.

Instructions:

- 1. Power off the Arduino and crystal source before powering on the PLL. Power on the PLL IC followed by the crystal source and then the Arduino. Automatic Power on Reset takes 250us.
- 2. Registers have default values after Automatic Power on Reset. All Registers need to be programmed after power on Reset.
- 3. Write PLL_REG_00 = 0x0000000 first upon power up.
- 4. At power-up, it is required that both SEN and SCK lines are initially held low. If the first rising edge occurs on the SCK line before any rising edges occur on the SEN Pin, SPI Open Mode is selected. If the first rising edge occurs on the SEN line before any rising edges occur on the SCK Pin, SPI HMC Mode is selected. My Code only works if HMC Mode is chosen.

5. For write to PLL subsystem, Register Address and Data must be written. The data is broken down into two fields.

6-bit Address	24-bit Data
---------------	-------------

6. For write to VCO subsystem, PLL_REG_05 must be written. The data is broken down into three fields. Bits [2:0]: 3-bit VCO_ID (always 0b000), Bits [6:3]: 4-bit VCO_REGADDR, Bits [15:7]: 9-bit VCO_DATA.

6-bit Address (0x5)	0x00 (eight	9-bit VCO	4-bit VCO_REG	3-bit VCO_ID
	0-bits)	Data	Address	

The VCO subsystem is written at a clock derived from the input reference clock (FSM or VSPI clock = XREF divided by 1/4/16/32). No other SPI activity must take place while VCO subsystem is being written (32 clock cycles of VSPI clock).

- 7. The last write must be to PLL_REG_03 in Integer mode; and PLL_REG_03 followed by PLL_REG_04 in Fractional mode. This applies when Auto calibration is enabled or disabled.
- 8. The VCO sub-band can be set using the CAPS variable. There are 256 sub-bands for the VCO range 1500MHz to 3000MHz.
- 9. For Auto calibration mode, write all PLL registers, followed by all VCO registers. After the last write, write VCO_REG_00 = 0x00, followed by PLL_REG_03 if using Integer Mode; or PLL_REG_03 and then PLL_REG_04 if using Fractional mode.
- 10. If the output does not meet required accuracy, use the HMC832 Evaluation Kit Software to find appropriate register values for a better frequency match and then program those register values.

Observations:

Power Up Voltages and Currents

- 1. DC Voltage and Current for HMC1060 Voltage Regulator = 5.5V, 200 mA
- 2. DC Voltage and Current for Reference Crystal IC = 3.3V, 150 mA

Frequency Locked at 2GHz in Integer Mode

- 3. N-Channel Output Power = +1.5dBm
- 4. P-Channel Output Power = -8.9dBm
- 5. DC Voltage and Current for HMC1060 Voltage Regulator = 5.5V, 202.2 mA
- 6. DC Voltage and Current for Reference Crystal IC = 3.3V, 162.1 mA

Register Settings for three LO Banks.
